Your photos as brick mosaics

Khaled Maroun · PIECES & BRICKS
Prepared by Softradix · 28 October 2026

We converted your photos into brick mosaics using only your 40 colours (C01–C40). For each photo you'll find the mosaic preview, a side-by-side comparison with the original, and the exact number of bricks of each colour.

How your photos become mosaics

1. **Find the faces.** We locate every face in the photo automatically, along with the position of the eyes.
2. **Crop a square.** The mosaic is always square, so we frame the people: head and shoulders for one person, the whole group for families.
3. **Make the faces clearer.** We gently brighten shadows on skin, which would otherwise turn into dark patches, and sharpen the eyes so they stay visible as separate bricks.
4. **Calm the background.** Busy backgrounds are smoothed into flatter areas so they don't compete with the faces.
5. **Shrink to the board.** The photo is reduced to 48 × 48 squares. Each square takes the average colour of its area of the photo.
6. **Choose the brick colour.** For each square we pick the closest of your 40 colours, using a colour-difference formula designed to match human vision. On faces only skin tones are allowed, so there are no green or grey patches on skin.
7. **Count every brick.** The counts always add up to exactly 2,304 bricks, and the same photo with the same settings always gives exactly the same mosaic.

Two finishes

Smooth (no dithering) uses solid areas of colour. Faces look clean and calm; we recommend it for portraits. **Textured** (dithering) mixes neighbouring colours to suggest in-between shades. Gradients look smoother from a distance, but faces get speckled. Both are shown for every photo.

What comes with every mosaic

• a brick-style preview, as the finished board will look
• a numbered building grid: every square shows its colour number, with row and column numbers
• the exact brick list per colour, always adding up to the full board
• the mosaic as a data file, so it can be edited, reordered or reproduced exactly

Bigger boards for group photos

On a 48 × 48 board a face in a family photo is only 6–7 bricks wide. For the two family photos we also show a 96 × 96 version, where every face becomes recognisable.

1. Portrait with colour background

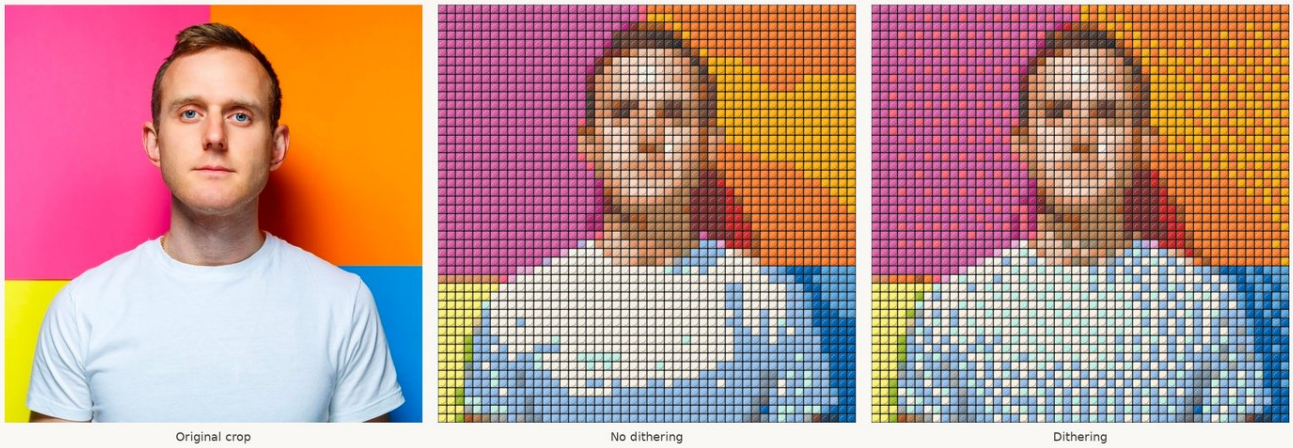

48 × 48 board · 2,304 bricks · 32 colours · Smooth finish (no dithering)

Clean, bold colours. The eyes and brows read clearly even at 48 × 48.

1. Portrait with colour background: comparison and brick list

P5 · Man, colour background · 48×48 · 2,304 bricks

Left: the cropped photo. Middle: smooth finish. Right: textured finish.

Total: 2,304 bricks in 32 colours

2. Toddler on the bench

48 × 48 board · 2,304 bricks · 27 colours · Smooth finish (no dithering)

A soft-focus photo; we sharpened the face before converting so the eyes stay visible.

2. Toddler on the bench: comparison and brick list

P4 · Toddler on bench · 48×48 · 2,304 bricks

Left: the cropped photo. Middle: smooth finish. Right: textured finish.

4. Studio family of five

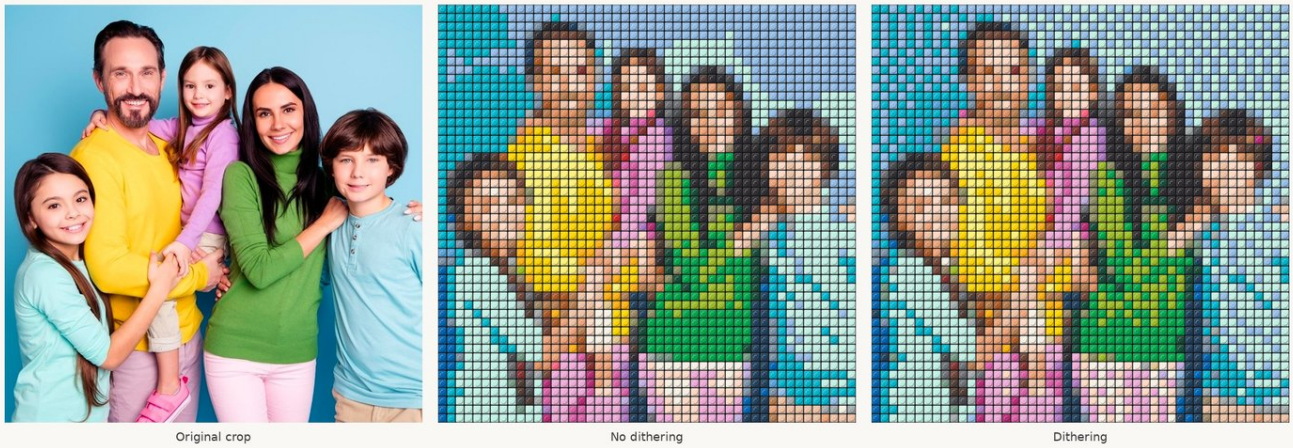

48 × 48 board · 2,304 bricks · 39 colours · Smooth finish (no dithering)

Five faces on one 48 × 48 board, so each face is only 6–7 bricks wide.

4. Studio family of five: comparison and brick list

P2A · Studio family, full · 48×48 · 2,304 bricks

Total: 9,216 bricks in 39 colours

6. Birthday family

48 × 48 board · 2,304 bricks · 22 colours · Smooth finish (no dithering)

The hardest photo: small faces and a busy background, which we simplified.

6. Birthday family: comparison and brick list

P3A · Birthday family, full · 48×48 · 2,304 bricks

Left: the cropped photo. Middle: smooth finish. Right: textured finish.

Next steps and a few questions

We'd be glad to walk you through these results live and convert any other photo you'd like to see.

Confirmed with you

• Board: 48 × 48 mosaic with 2,304 single-colour positions, for the best facial clarity.

• Shape: square boards only, so every photo is cropped to a square.

A few answers that will help us fine-tune the system

1. Physical size: how big is the finished mosaic in cm? This sets the exact proportions of the preview.

2. Colours: were the 40 HEX values measured from real bricks, or taken from a supplier catalogue? Measured values give the most faithful results.

3. Sizes: which sizes besides 48 × 48 do you plan to sell?
